[Portfolio](#)

[GitHub](#)

Technical Product Manager with 6+ years in software engineering and hands-on 0→1 AI product ownership - from customer discovery and product definition to prototypes, engineering-ready requirements and shipped systems.

I translate ambiguous user problems and AI capabilities into clear scope, PRDs, technical trade-offs, acceptance criteria, success metrics and testable product experiences.

PRODUCT

AI & ENGINEERING

EDUCATION

B.Tech, Computer Science & Engineering

Rajasthan Technical University

Poornima College of Engineering, Jaipur

Product Journey

CookBridge · TPM / Product Builder

Mar 2026 - Present

[Live Prototype ↗](#)

“Aaj khaane mein kya banaye?” / “What should we cook today?”

0→1 AI meal-decision product for households with cooks, designed to reduce recurring decision effort and household context recall.

- **Customer discovery & validation:** researched 10 households; 7/10 reported recurring meal-decision friction, then narrowed v1 to working professionals managing family meals with a cook.
- **Product definition & requirements:** translated discovery into the problem statement, hypothesis, v1 scope/out-of-scope, end-to-end flow, functional requirements, edge cases and acceptance criteria for engineering.
- **AI product / system design:** defined LLM recommendation context across diet, explicit and learned preferences, ingredients and meal history, plus preference-priority and conversation-recovery behaviour.
- **Prototyping & validation:** built a mobile-first interactive prototype and WhatsApp/LLM flow to make requirements tangible and test the experience before deeper engineering investment.
- **Metrics & trade-offs:** defined decision time and fridge-check reduction as primary success metrics; instrumented recommendation, confirmation and abandonment signals and prioritised low-effort inventory inputs to reduce adoption risk.

7/10 problem validation

Metrics + instrumentation

AI Fashion Stylist · Product Builder

Dec 2025 - Feb 2026

[Demo on Portfolio ↗](#)

“Full wardrobe, but nothing to wear?”

- **Discovery:** researched Acloset and Indyx, spoke with the Indyx founder and studied how people organise wardrobes and decide what to wear.
- **Working AI prototype:** built a WhatsApp stylist that converted 5 wardrobe photos into a structured closet of 18 detected items, then generated 3 outfit options using only clothes the user owns.
- **Product decomposition:** structured the experience as wardrobe extraction → context / vibe → recommendation → feedback, reducing repeated preference input.
- **Cost / feasibility trade-off:** stopped scope expansion when AI inference cost became part of validation economics, prioritising learning over feature breadth.

Working AI prototype

5 photos → 18 items

Research + cost trade-offs

THE THROUGHLINE

6+ years in engineering gives me the technical depth to work directly with engineers on APIs, system constraints, architecture and production trade-offs.

Product work adds discovery, requirements, prioritisation, prototyping and outcome measurement. I am strongest in small teams where one person is expected to create clarity and own the path from problem to shipped product.

Engineering Journey

Alpha Nodus · Senior Software Developer

Jun 2025 - Aug 2025

- **End-to-end production ownership:** owned Greeter/Kiosk, a healthcare check-in product across frontend, APIs/integrations, infrastructure and AWS deployment.
- **Cross-layer technical execution:** moved beyond frontend implementation into system integration, deployment and production delivery decisions.

Frontend + APIs + AWS

Production ownership

JediSwap & Hackathons Frontend Engineer / Builder

Jul 2023 - Oct 2024

- **Shipped technical product flows:** built JediSwap Missions and simplified wallets, NFTs and blockchain transactions into usable Starknet experiences.
- **0→1 under tight constraints:** built GlassChain at ETHIndia and TailTales at Starknet Hacker House, moving from idea to working product in compressed timelines.

Web3 product flows

0→1 prototyping

Hackathon delivery

Playment / TELUS · Senior Frontend Developer

Dec 2019 - Feb 2023

Grew from frontend engineer to senior ownership across product workflows, architecture and engineering decisions.

- **Product & technical ownership:** owned GT Studio workflows and moved from feature implementation into product discussions, workflow decisions and architecture.
- **Engineering leverage:** consolidated 5 frontend repositories into one monorepo, reducing duplicated development and improving shared code reuse.
- **Reusable product systems:** built Pixel, a shared React component library, plus complex annotation interfaces using KonvaJS and Three.js.

Product + architecture ownership

5 repos → 1 monorepo

Shared UI systems

Earlier Experience · Frontend Engineer

2018 - 2019

- **ClearGlass Analytics:** built investment analytics dashboards and data-heavy product interfaces.
- **Unifize Solutions:** progressed from frontend intern to engineer, learning how requirements, engineering decisions and shipped experiences connect.

Data-heavy interfaces

Intern → engineer
